The Model 375 Centering Pin is used to center your router bit, up to 1/2 inch in diameter, in your guide bushing.

First install the guide bushing firmly on the router base plate. Loosen the mounting screws on the base plate. Plunge and lock the router in the down position. Install the centering pin in the router so that the cone of the pin can be pushed against the bushing when the router lock is released. Restrain the router so that it does not snap hard against the pin and release the lock. Move the plate so that the bushing is centered on the centering pin cone. Tighten the mounting screws to hold the base plate in the centered position.
